INTRODUCTION

Ruby is a programming language that appeared in 1993, as an unique way to create software applications with more understandable code, and giving programmers many possibilities to create their applications.

But its peak was on 2004 with the development of "Ruby on Rails" created by David Heinemeier Hansson, or commonly named DHH. Rails uses a lot of architecture design and different modeling process to the creation of web applications giving the programmer many facilities and helping to create something new with a lot of structure and in short time.

Actually ruby is still used, but its community has been decreased in the last years with the emergence of new technologies that could make the same with less structure and more flexibility.
